

Onicoker

Local treatment that can promote fingernail hydration and strengthening, thanks to Urea, Mandelic Acid Millet Oil extract and its high Silicon content. In addition, the presence of Chitosan allows the product to leave an invisible protective layer on the nail plate and cuticle. Water-soluble, quick drying.

ONICOKER is a water-soluble lacquer containing three moisturizing substances (urea, mandelic acid and glycerin) capable of increasing the water content in the nail plate and strengthening the nail. Also the fluid summer of millet, due to its high silicon content, gives nourishment and hardening to the foil. It is indicated in case of nail fragility, lamina straiture and onycholysis. Chitosan protects the lamina by forming an invisible layer and allows to keep the other active substances in contact with the nail.

HOW TO USE

Apply to the nails 1 time per day with the applicator, and leave to dry without washing off in.
